AI GOVERNANCE & COMPLIANCE GAP ASSESSMENT

Controls for an AI support assistant

The assistant drafts responses for one support team in a staging environment.

Scope

Compare three agreed internal requirements with the supplied staging controls and records.

Evidence reviewed

E1 Workflow export v2.1 and test T-04: send requires an agent confirmation.

E2 Event schema v2.1: records send time and ticket ID but has no approver field.

E3 Monitoring procedure v1.2: requires weekly sampling, with no completed records supplied.

Findings

R1 | Human approval | SUPPORTED
E1 shows the approval gate was exercised in the tested staging workflow.

R2 | Record approver | DEMONSTRATED GAP
E2 shows the reviewed event schema lacks a field for the required approver identity.

R3 | Weekly sampling | UNESTABLISHED
E3 describes the control but the materials do not establish that weekly checks occurred.

Limits

Findings cover the agreed staging workflow and the three internal requirements reviewed.

Next step

Prioritize capturing the approver identity and obtain completed monitoring records before assessing production readiness.
