FAAR STAGE 1

Scoping a cross-border assembly project

An importer plans to bring components into a market, use a local contractor for assembly and sell finished goods locally.

Scope

Map the proposed operations and responsibilities before defining the next stage of work.

Evidence reviewed

E1 Project brief: the importer intends to source and distribute the components and finished goods.

E2 Draft flow map: components move through a warehouse to the contractor and then to local distribution.

E3 Draft roles note: the contractor operates the assembly site and the importer-of-record role is unassigned.

Findings

Project map
Importer coordinates supply and distribution, warehouse handles storage and contractor handles assembly.

Workstream map
Import, site operations and finished-goods distribution can be scoped as separate workstreams.

Blind-spot register
Importer-of-record responsibility, transfer of ownership and the assembly site's approvals remain open.

Stage 2 frame
Confirm roles and ownership first, then commission separate import and site-operations reviews.

Limits

The map reflects the supplied drafts and identifies dependencies for subsequent scoping.

Next step

Obtain a signed role map and confirm which activities take place at the assembly site before agreeing Stage 2.
