PUBLIC SAMPLE 01

# What can a support agent actually establish?

A black-box pilot of factual answers, knowledge limits and access to published policy.

**MIXED FINDINGS**

Several narrow observations were established, while broader promises remained UNESTABLISHED.

## 1. Question and boundary

Does a public support agent answer selected factual questions consistently with the company information available within the pilot boundary?

The reviewed object was the provider's own public support agent during a fixed historical observation window.

The product builder, customer agents and backend enforcement were outside the object.

## 2. Evidence and method

The original pilot compared recorded live conversations with a fixed set of public product, pricing, terms and privacy pages.

Selected factual questions were compared across independent sessions.

The review separated the content of each observed answer from broader claims about accuracy, availability and data provenance.

## 3. Established observations

Selected pricing answers agreed with the fixed public source.

The same selected factual limits were repeated without a material contradiction in two independent sessions.

When the model supplier was not established by the reviewed public sources, the agent acknowledged that it lacked that information.

PUBLIC SAMPLE 01 / FINDINGS AND LIMITS

## 4. A material information gap

When asked about personal information shared in chat, the agent did not communicate relevant information already present in the published privacy policy.

The agent did not invent a replacement policy in that observed answer.

This established an information gap in the answer, without establishing unlawful processing or a technical privacy failure.

## 5. What remained UNESTABLISHED

A few correct answers did not establish general accuracy across all questions.

Observed availability did not establish uninterrupted availability.

A broad speed promise could not be assessed without a defined threshold and suitable timing evidence.

Agreement with public information did not establish which internal knowledge source caused the answer.

A context-sensitive recommendation did not establish every possible meaning of personalized support.

## 6. Bounded conclusion

The original pilot recorded PARTIALLY ESTABLISHED / MATERIAL LIMITATIONS as its descriptive summary, rather than a new canonical ANDEKS status code.

The useful result was a separation between correct local answers, a demonstrated information gap and wider claims that the evidence could not establish.

A claim about a later version would require a separately defined object and fresh evidence.

## About this public adaptation

This public sample is a shortened, anonymized adaptation of a completed historical pilot record.

Names, product identifiers, URLs, exact dates and identifying operational details have been removed or generalized.

The findings retain the meaning and limits of the source record, but this adaptation is not its authoritative replacement.

No new system execution, reproduction or assessment was performed to prepare this PDF.

This sample illustrates selected ANDEKS methodological principles and does not constitute a new formal ANDEKS normative assessment or certification.

It does not claim use of ARE or ERA, production readiness, legal compliance or approval for deployment.

Historical findings do not establish the present condition of any system.
