PUBLIC SAMPLE 02

Reproducible numbers. Unresolved evidence.

An evidence-only review showing why a calculation can be correct while the exact claim remains UNESTABLISHED.

UNESTABLISHED

The calculation could be reproduced, but the evidence did not unambiguously connect the measured question to the reported change.

1. Question and boundary

Did the closed evidence package establish a reported change in employee perceptions within one defined population?

The claim concerned observed change between two measurement rounds.

Causality, objective fairness, persistence and generalization beyond that population were outside the object.

2. Evidence and method

The original record reviewed the measurement wording, submitted data rows, calculation rule, collection dates and population records.

Positive-response counts and denominators were checked against the submitted rows.

The review then traced the calculation back to the exact question said to have generated those responses.

This was a documentary evidence review, rather than a new survey or a live software execution test.

3. What the package supported

The submitted rows reproduced the reported arithmetic after rounding.

The package contained a consistent stated population boundary and measurement dates.

The two rounds had different respondent counts, so the data did not establish individual change in the same employees.

PUBLIC SAMPLE 02 / FINDINGS AND LIMITS

4. The decisive evidence gap

The instrument documents described a question combining fairness and transparency in decisions affecting the respondent's work.

The data document instead identified a question about fairness of decisions in the division generally.

Both were represented as the exact measurement basis for the same claim.

Treating those questions as equivalent would require an assumption outside the closed evidence package.

5. A separate provenance limit

The package did not contain an original collection-system export or another independent artifact linking the presented rows to primary response collection.

Internal arithmetic reproducibility therefore did not establish independent provenance of the submitted rows.

6. Bounded conclusion

UNESTABLISHED applied to the exact claim within the frozen object and closed evidence package.

It did not mean the arithmetic was wrong, the data were fabricated or the intervention had no effect.

The assessment could not choose a preferred question wording or repair the submitting party's evidence by assumption.

Corrected wording or additional source evidence would require a new or revised assessment object, without rewriting the historical result.

About this public adaptation

This public sample is a shortened, anonymized adaptation of a completed historical pilot record.

Names, product identifiers, URLs, exact dates and identifying operational details have been removed or generalized.

The findings retain the meaning and limits of the source record, but this adaptation is not its authoritative replacement.

No new system execution, reproduction or assessment was performed to prepare this PDF.

This sample illustrates selected ANDEKS methodological principles and does not constitute a new formal ANDEKS normative assessment or certification.

It does not claim use of ARE or ERA, production readiness, legal compliance or approval for deployment.

Historical findings do not establish the present condition of any system.
