Evidence Assessment Report

PUBLIC DEMONSTRATION | Not a customer engagement

REPORT ID	BV-CC-DEMO-002
ASSESSMENT DATE	2026-11-01
SOURCE	RFC 9110 — HTTP Semantics (June 2022)

01 Claim under assessment

Under RFC 9110, an HTTP 404 response definitively proves that the requested resource has been permanently removed.

02 Identified primary source

RFC Editor, *RFC 9110: HTTP Semantics*, June 2022, Sections 15.5.5 and (where relevant) 15.5.11.

Public source: https://www.rfc-editor.org/rfc/rfc9110.html#section-15.5.5

03 Assessment boundary

This check is limited to the meaning and evidentiary reach of RFC 9110. It does not inspect any live HTTP response, server log, website history or publisher intention.

04 Relevant source evidence

E1 — Section 15.5.5: A 404 response means no current representation was found or the server is unwilling to disclose one. The provision does not establish whether that condition is temporary or permanent.

E2 — Section 15.5.11: The separate 410 Gone status indicates likely permanent unavailability; 404 remains appropriate when permanence is unknown.

05 Evidence standing

NOT SUPPORTED

The claim attributes definitive permanence to 404. The primary source explicitly denies that inference; therefore the claim is contradicted within the selected normative source.

Reasoning & Methodological Record

Report BV-CC-DEMO-002 | Public demonstration

06 Claim-to-evidence reasoning

Exact proposition: Under RFC 9110, an HTTP 404 response definitively proves that the requested resource has been permanently removed.

Primary-source observation: Section 15.5.5 says 404 does not distinguish temporary from permanent lack of representation. Section 15.5.11 describes 410 Gone as indicating likely permanent unavailability.

Assessment inference: The claim attributes definitive permanence to 404. The primary source explicitly denies that inference; therefore the claim is contradicted within the selected normative source.

07 Uncertainty and limitations

This finding concerns the stated meaning of status codes; it does not assess a specific website or its content.

No additional sources were used to establish the finding. The source is a published protocol specification, not a record of a particular incident.

08 Traceability record

Publisher: RFC Editor / Internet Engineering Task Force (IETF).

Document: RFC 9110, HTTP Semantics, June 2022.

Evidence locator: Sections 15.5.5 and 15.5.11.

Canonical link: https://www.rfc-editor.org/rfc/rfc9110.html#section-15.5.5

Processing environment: Manual, source-based analysis. No ARE/ERA execution is claimed.

09 Methodological basis

This report demonstrates selected methodological principles associated with ANDEKS(TM) v0.3: explicit assessment boundary, source traceability, evidence-to-claim reasoning, and separation of the finding from any downstream decision authority. The evidence-standing label is specific to this BoxVia service.

10 Scope and reliance notice

This public sample is illustrative and was not commissioned by a client. It is not a formal ANDEKS(TM) normative assessment, certification, legal advice or comprehensive audit. Findings are confined to the claim and identified primary source.
